

In the Claims:

Cancel claims 2 and 9 without estoppel or disclaimer of the subject matter thereof, amend claims 1, 4 and 10, and add dependent claim 13, as follows:

1. (Currently Amended) An apparatus for performing a surgical procedure comprising:

an inner cannula having an elongated body and a tip that is positioned at a distal end of the elongated body and that is configured to dissect tissue; and

an outer expandable sheath disposed about the inner cannula and including first and second shells adjacently aligned along longitudinal edges thereof ~~configured~~ to expand in an outward direction responsive to the tip of the inner cannula slidably passing longitudinally through the sheath.

2.-3. (Cancelled)

4. (Currently Amended) The apparatus of claim 1, wherein the outer expandable sheath further comprises:

~~a first shell and a second shell adjacently aligned along longitudinal edges thereof, and~~

a resilient connector attached between the first and second shells for resiliently urging the longitudinal edges of the shells together.

5. (Previously Presented) The apparatus of claim 4 in which the outer expandable sheath further comprises:

a retainer disposed near at least one of proximal and distal ends of the shells for retaining the shells against relative longitudinal movement during slidable passage of the tip on the inner cannula longitudinally through the outer expandable sheath.

6. (Previously Presented) The apparatus of claim 1 in which the inner cannula and outer expandable sheath are separable to allow the outer expandable sheath to remain in place at a surgical site as the inner cannula and the tip attached thereto are withdrawn.

7. (Previously Presented) The apparatus of claim 4 wherein the resilient connector resiliently urges a distal end of the first shell toward a distal end of the second shell to form an inner dimension at the distal end of the outer expandable sheath smaller than the outer dimension of the tip positioned distally of the distal end of the outer expandable sheath.

8. (Original) The apparatus of claim 7 wherein the outer expandable sheath further comprises:

a second resilient connector disposed to resiliently urge a proximal end of the first shell toward a proximal end of the second shell

to form an inner dimension at the proximal end of the outer expandable sheath smaller than the outer dimension of the tip in the absence of an outwardly expansive force applied to the proximal end of the outer expandable sheath in response to the tip passing through the proximal ends of the shells.

9. (Cancelled)

10. (Currently Amended) The apparatus of claim 1 in which the tip is disposed on the inner cannula distally of the outer sheath, the tip further ~~comprises~~ comprising a distal tapered end for dissecting tissue, a proximal tapered end, and an enlarged intermediate portion having an outer dimension greater than an inner dimension of the sheath for exerting lateral expansion force against the outer expandable sheath responsive to slidable passage of the tip longitudinally through the outer expandable sheath.

11. (Withdrawn) An elongated cannula for performing endoscopic procedures comprising:

an instrument lumen within the cannula having an access port
positioned at a proximal end of the cannula for receiving
instruments into the instrument lumen;
an endoscopic lumen disposed within the cannula;

a wire lumen within the cannula;
a wire positioned within the wire lumen having a distal end attached
to a distal end of the cannula; and
an articulating lever positioned near the proximal end of the cannula
attached to the proximal end of the wire, for tensioning the wire
in a first position to deflect a distal portion of the cannula out of
alignment with a proximal portion of the cannula, and for
relaxing the wire in a second position of the lever to orient the
distal portion of the cannula substantially in alignment with the
proximal end of the cannula.

12. (Withdrawn) The elongated cannula according to claim 11 including an
endoscope disposed within the cannula including an endoscopic eyepiece disposed
near a proximal end of the endoscope in skewed angular orientation relative to the
elongated cannula and out of alignment with the access port of the instrument
lumen and lever to avoid spatial interference of the eyepiece with the lever and
with instruments received in the instrument lumen.

13. (New) Apparatus according to claim 1 in which the first and second
shells are configured as substantially half cylindrical segments adjacently aligned
along the longitudinal edges thereof.
